

Table of Contents:

A. Set up:

- ☐ See Table

B. Snort Overview:

- ☐ See Table

C. Snort Sniffer Mode:

- ☐ **Section 1:** Sniff interface 1 with **[snort -v -i1]** [verbose]
- ☐ **Section 2:** Sniff interface 1 with **[snort -v -d -i1] __ & [dump(application layer)]**
- ☐ **Section 3:** Sniff interface 1 with **[snort -v -d -e -i1] __/__ &[second layer header info]**

D. Packet Logger Mode:

- ☐ **snort -dev -i1 -l c:\snort\log** → creates a local snort.log file
- ☐ **snort -dev -i1 -l c:\snort\log -b** → creates snort.log binary file [for high speed network]
- ☐ After pings, both **standard & binary snort.log files** are present inside **c:\snort\log dir**
- ☐ Open **binary snort.log 1524878881** in wireshark to see **ICMP** ping traffic

E. Intrusion Detection Mode:

- ☐ **Create a snort configuration file** c:\snort\etc\temp.conf
- ☐ Start snort with the **temp configuration file**
- ☐ **Create TCP traffic** by writing **teammate IP address**
- ☐ Inside the **C:\snort\log directory** on both my PC & partner PC → **alert.ids** created
- ☐ Inside **alert.ids** file → See all alerts generated by **temp.conf** rule
- ☐ **snort summary**

Conclusion:

BONUS:

- ☐ See Table
- ☐ Preprocessor Error
- ☐ The following rules file/local.rules was created to build alerts
- ☐ Alerts were logged to snort\log>alert.ids

Section 1: Sniff interface 1 with [snort -v -i1] [verbose]

Snort is now running from the **Network Adapter 1** and listens to the network traffic.

```
c:\Snort\bin>snort -v -i1
Running in packet dump mode

==== Initializing Snort ====
Initializing Output Plugins!
pcap DAQ configured to passive.
The DAQ version does not support reload.
Acquiring network traffic from "\Device\NPF_{E3645972-9DF7-46AD-97E6-D27208887D81}".
Decoding Ethernet
```

While snort runs[snort -v -i1], ping partner PC[10.140.100.104]

```
C:\Users\Student>ping 10.140.100.104 -t

=====

```

D. Packet Logger Mode

snort -dev -i1 -l c:\snort\log → creates a local snort.log file

```

c:\Snort\bin>snort -dev -i1 -l c:\snort\log
Running in packet logging mode

```

snort -dev -i1 -l c:\snort\log -b → creates a local snort.log binary file [for high speed network]

```

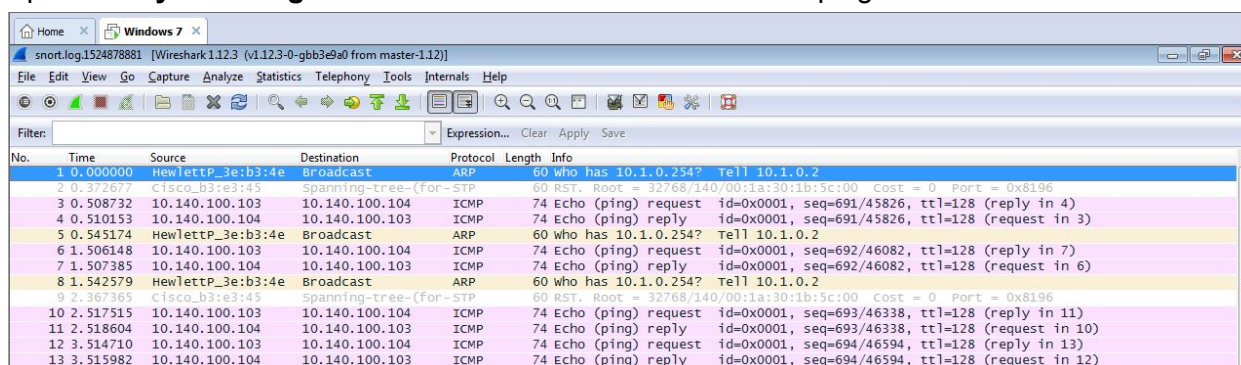

c:\Snort\bin>snort -dev -i1 -l c:\snort\log -b
Running in packet logging mode

```

After pings, both **standard & binary snort.log** files are present inside **c:\snort\log** dir

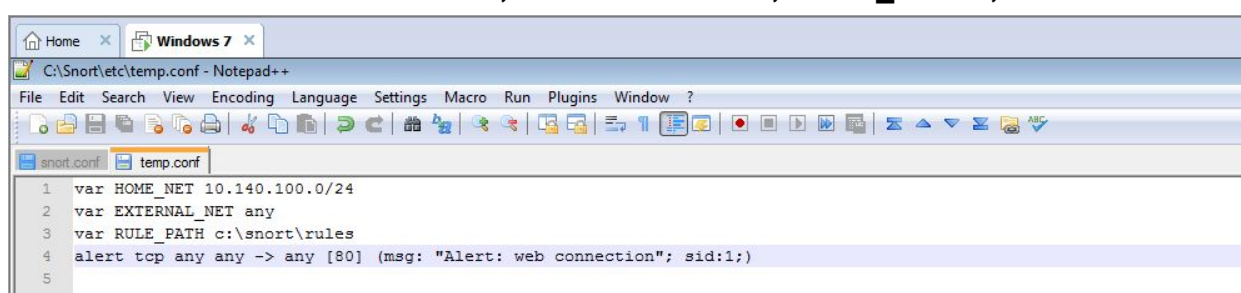

Open **binary snort.log 1524878881** in wireshark to see **ICMP** ping traffic

E. Intrusion Detection Mode

Create a snort configuration file **c:\snort\etc\temp.conf**

The file defines the **home network**, **external network**, **RULE_PATH**, and 1 basic rule

Start snort with the **temp configuration file** and create a **log file**

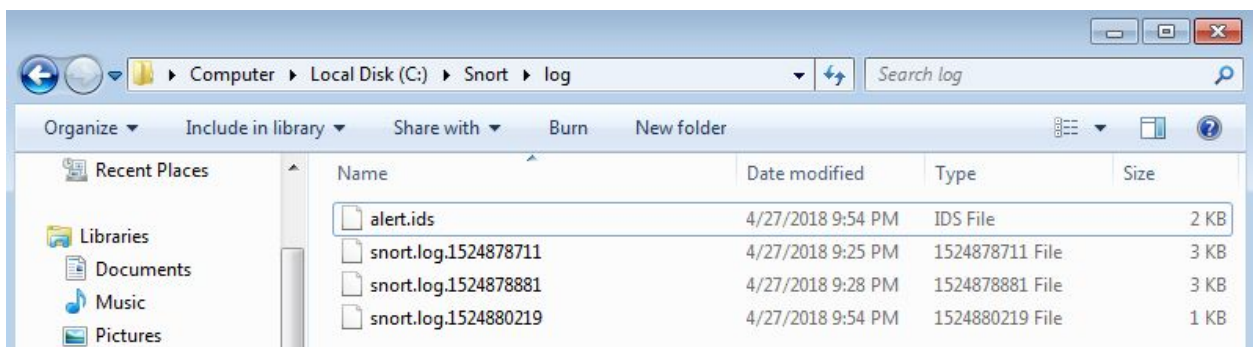

Instead of pinging, **create TCP traffic** by writing **teammate IP address** in browser

Partner creates **TCP** traffic by writing my IP address in their browser

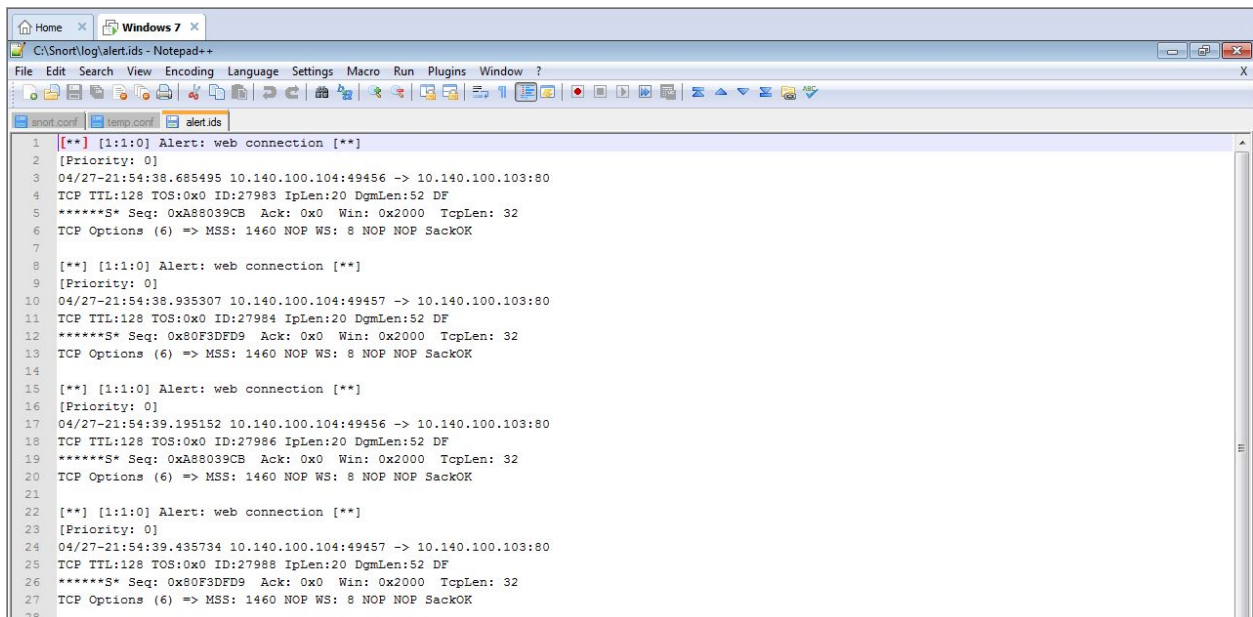

Inside the **C:\snortlog** directory on both my PC & partner PC → **alert.ids** created

Inside **alert.ids** file → See all alerts generated by **temp.conf** rule

alert tcp any any → any [80] (msg: "alert: web connection"; ssid: 1;)

NOTE: All alerts in alert.ids file are detecting TCP traffic as per the above rule..

snort summary → Throughout the lab experiment. **TCP/ UDP/ICMP** was all detected

```

```

Conclusion:

My main interests in this lab were learning how to specify different snort parameters [-v -d -e], saving binary files, analyzing the snort traffic in wireshark, and then learning how to build alerts and log them to a local file. Because of the preprocessor errors I received, I decided to download the registered rules from snort.org and write a snort.conf file that is adjusted for a windows machine. Those changes can be found in the table I created in the bonus section. Running a new snort.conf file removed any errors, at which point, I decided to create more alerts. In the local.rules file, I captured TCP, UDP, ICMP with new rules. I was able to see the corresponding alerts after I re-ran snort and viewed alert.ids.

BONUS:

“**snort -i1 -l c:\snort\log -c c:\snort\etc\temp.conf**” →
generates a preprocessor warning.

```

Commencing packet processing (pid=6800)
WARNING: No preprocessors configured for policy 0.
WARNING: No preprocessors configured for policy 0.
WARNING: No preprocessors configured for policy 0.
WARNING: No preprocessors configured for policy 0.
WARNING: No preprocessors configured for policy 0.

```

Dynamicpreprocessor directory c:\Snort\lib\snort_dynamicpreprocessor
Dynamicengine c:\snort\lib\snort_dynamicengine\sf_engine.dll

After running a similar command with a different conf file containing these changes:
In addition to the snort Registered rules [[snortrules-snapshot-29110.tar.gz](#)] download
The following rules were adapted for windows ...

```
#snort rule path
var RULE_PATH c:\Snort\rules
```

```
#snort preprocessor rule path
var PREPROC_RULE_PATH c:\Snort\preproc_rules
```

Section 2:

```
#configure default log directory
config logdir: c:\Snort\log
```

Section 4:

```
#path to dynamic preprocessor libraries
dynamicpreprocessor directory c:\Snort\lib\snort_dynamicpreprocessor
```

```
#path to base processor engine
dynamicengine c:\snort\lib\snort_dynamicengine\sfeengine.dll
```

Section 6:

```
#syslog
```

```
output alert_syslog: LOG_AUTH LOG_ALERT
```

Section 7:

NOTE: replace all forward slashes(/) to back slashes(\) for all include statements

Section 8:

```
#decoder and preprocessor event rules
Include $PREPROC_RULE_PATH\preprocessor.rules
Include $PREPROC_RULE_PATH\decoder.rules
Include $PREPROC_RULE_PATH\sensitive-data.rules
```

The following rules file/local.rules was created to build alerts

```
#-----
# LOCAL RULES
#-----
alert ICMP any any -> any any (msg:"Testing ICMP alert"; sid: 1000001;)
alert TCP any any -> any any (msg:"Testing TCP alert"; sid: 1000002;)
alert UDP any any -> any any (msg:"Testing UDP alert"; sid: 1000003;)
```

Alerts were logged to snort\log\alert.ids

```
